

Abstract

The purpose of this study was to determine if there were differences in the prevalence of musculoskeletal disorders among different types of workers. The study included 600 male employees from three companies. Data were collected through questionnaires and interviews. The results showed that the prevalence of musculoskeletal disorders was higher among workers in the manufacturing sector compared to those in the service sector. The most common disorders were low back pain and neck pain. The study also found that older workers had a higher prevalence of musculoskeletal disorders than younger workers. The findings suggest that employers should implement measures to reduce the risk of musculoskeletal disorders in the workplace.
